

Device for Administering an Injectable Product

ABSTRACT OF THE DISCLOSURE:

The invention relates to a device for administering an injectable product, comprising:

- a) a casing (3);
- b) a container for said product accommodated by said casing (3)
- c) a delivering means (2) for delivering product out of said container (1);
- d) a drive means (8); and
- e) a transmission link via which said drive means (8) drives said delivering means (2).

The device is characterised in that:

- f) a fluid space (21, 22) for an incompressible fluid and
- g) a pressure reducing means (3, 10, 23) are provided in said transmission link;
- h) wherein said fluid space (21, 22) can be impinged on a drive side by pressure from said drive means (8) and said pressure reducing means (3, 10, 23) reduces a fluid pressure generated by said drive means (8) toward a driven side of said fluid space (21, 22).
